LIBRARIES

To load any library (including developer tools, ports, and contributions), use the goal `logtalk_load(library_name(loader))`. To run the library tests, use the goal `logtalk_load(library_name(testing))`. To load an entity, always load the loader file of the library that includes it to ensure that all required dependencies are also loaded and that any required flags are used. The loading goal can be found in the entity documentation.

Remarks:

- Logtalk specific types: entity, object, protocol, category, entity_identifier, object_identifier, protocol_identifier, category_identifier, event, predicate.
- Prolog module related types (when the backend compiler supports modules): module, module_identifier, qualified_callable.
- Prolog base types: term, var, nonvar, atomic, atom, number, integer, float, compound, callable, ground.
- Atom derived types: non_quoted_atom, non_empty_atom, non_empty_atom(CharSet), boolean, character, in_character, char, operator_specifier, hex_char.
- Atom derived parametric types: atom(CharSet), atom(CharSet,Length), non_empty_atom(CharSet), character(CharSet), in_character(CharSet), char(CharSet).
- Number derived types: positive_number, negative_number, non_positive_number, non_negative_number.
- Float derived types: positive_float, negative_float, non_positive_float, non_negative_float, probability.
- Integer derived types: positive_integer, negative_integer, non_positive_integer, non_negative_integer, byte, in_byte, character_code, in_character_code, code, operator_priority, hex_code.
- Integer derived parametric types: character_code(CharSet), in_character_code(CharSet), code(CharSet).
- List types (compound derived types): list, non_empty_list, partial_list, list_or_partial_list, list(Type), list(Type,Length), list(Type,Min,Max), list(Type,Length,Min,Max), non_empty_list(Type), codes, chars.
- Difference list types (compound derived types): difference_list, difference_list(Type).
- List and difference list types length: The types that do not take a fixed length generate lists with a length in the [0,MaxSize] interval ([1,MaxSize] for non-empty list types).
- Predicate and non-terminal indicator types arity: These types generate indicators with an arity in the [0,MaxSize] interval.
- Other compound derived types: compound(Name,Types), predicate_indicator, non_terminal_indicator, predicate_or_non_terminal_indicator, clause, grammar_rule, pair, pair(KeyType,ValueType).
- Other types: Object::Closure, between(Type,Lower,Upper), property(Type,LambdaExpression), one_of(Type,Set), var_or(Type), ground(Type), types(Types), types_frequency(Pairs), transform(Type,Closure), constrain(Type,Closure).
- Type Object::Closure notes: Allows calling public object predicates as generators and shrinkers. The Closure closure is extended with either a single argument, the generated arbitrary value, or with two arguments, when shrinking a value.
- Type compound(Name,Types) notes: Generate a random compound term with the given name with a random argument for each type.
- Type types_frequency(Pairs) notes: Generate a random term for one of the types in a list of Type-Frequency pairs. The type is randomly selected taking into account the types frequency.
- Type transform(Type,Closure) notes: Generate a random term by transforming the term generated for the given type using the given closure.

- Type constrain(Type,Closure) notes: Generate a random term for the given type that satisfy the given closure.
- Registering new types: Add clauses for the arbitrary/1-2 multifile predicates and optionally for the shrinker/1 and shrink/3 multifile predicates. The clauses must have a bound first argument to avoid introducing spurious choice-points.
- Shrinking values: The shrink/3 should either succeed or fail but never throw an exception.
- Character sets: ascii_identifier, ascii_printable, ascii_full, byte, unicode bmp, unicode_full.
- Default character sets: The default character set when using a parameterizable type that takes a character set parameter depends on the type.
- Default character sets: Entity, predicate, and non-terminal identifier types plus compound and callable types default to an ascii_identifier functor. Character and character code types default to ascii_full. Other types default to ascii_printable.
- Caveats: The type argument (and any type parameterization) to the predicates is not type-checked (or checked for consistency) for performance reasons.
- Unicode limitations: Currently, correct character/code generation is only ensured for XVM and SWI-Prolog as other backends do not provide support for querying a Unicode code point category.

Public predicates

`arbitrary/1`

Table of defined types for which an arbitrary value can be generated. A new type can be registered by defining a clause for this predicate and adding a clause for the `arbitrary/2` multifile predicate.

Compilation flags:

static, multifile

Template:

`arbitrary(Type)`

Mode and number of proofs:

`arbitrary(?callable) - zero_or_more`

`arbitrary/2`

Generates an arbitrary term of the specified type. Fails if the type is not supported. A new generator can be defined by adding a clause for this predicate and registering it via the `arbitrary/1` predicate.

Compilation flags:

static, multifile

Template:

`arbitrary(Type,Term)`

Meta-predicate template:

`arbitrary(:;*)`

Mode and number of proofs:

`arbitrary(@callable,-term) - zero_or_one`

`shrinker/1`

Table of defined types for which a shrinker is provided. A new shrinker can be registered by defining a clause for this predicate and adding a definition for the `shrink/3` multifile predicate.

Compilation flags:

static, multifile

Template:

shrinker(Type)

Mode and number of proofs:

shrinker(?callable) - zero_or_more

shrink/3

Shrinks a value to a smaller value if possible. Must generate a finite number of solutions. Fails if the type is not supported. A new shrinker can be defined by adding a clause for this predicate and registering it via the shrinker/1 predicate.

Compilation flags:

static, multifile

Template:

shrink(Type,Large,Small)

Mode and number of proofs:

shrink(@callable,@term,-term) - zero_or_more

shrink_sequence/3

Compilation flags:

static

Template:

shrink_sequence(Type,Value,Sequence)

Mode and number of proofs:

shrink_sequence(@callable,@term,-list(term)) - zero_or_one

`edge_case/2`

Table of type edge cases. Fails if the given type have no defined edge cases. New edge cases for existing or new types can be added by defining a clause for this multifile predicate.

Compilation flags:

static, multifile

Template:

`edge_case(Type,Term)`

Mode and number of proofs:

`edge_case(?callable,?term) - zero_or_more`

`get_seed/1`

static

Template:

`get_seed(Seed)`

Mode and number of proofs:

`get_seed(-ground) - one`

`set_seed/1`

Sets the random generator seed to a given value returned by calling the `get_seed/1` predicate.

Compilation flags:

static

Template:

`set_seed(Seed)`

Mode and number of proofs:

`set_seed(+ground) - one`

`max_size/1`

User defined maximum size for types where its meaningful and implicit. When not defined, defaults to 42. When multiple definitions exist, the first valid one found is used.

Compilation flags:

static, multifile

Template:

`max_size(Size)`

Mode and number of proofs:

`max_size(?positive_integer) - zero_or_one`

1.6.6 coupling_metric

Compilation flags:

Uses:

Remarks:

- Efferent coupling (Ce): Number of entities that an entity depends on.
- Afferent coupling (Ca): Number of entities that depend on an entity.

- Instability (I): Computed as $C_e / (C_e + C_a)$. Measures the entity resilience to change. Ranging from 0 to 1, with 0 indicating a maximally stable entity and 1 indicating a maximally unstable entity. Ideally, an entity is either maximally stable or maximally unstable.
- Abstractness (A): Computed as the ratio between the number of static predicates with scope directives without a local definition and the number of static predicates with scope directives. Measures the rigidity of an entity. Ranging from 0 to 1, with 0 indicating a fully concrete entity and 1 indicating a fully abstract entity.
- Entity score: Represented as the compound term `ce_ca_i_a(Ce,Ca,I,A)`.
- Dependencies count: Includes direct entity relations plus calls or dynamic updates to predicates in external objects or categories.

Remarks:

- Definition of operators: Predicates declared, user-defined, and called are interpreted as operators. Built-in predicates and built-in control constructs are ignored.
- Definition of operands: Predicate arguments are abstracted and interpreted as operands. Note that this definition of operands is a significant deviation from the original definition, which used syntactic literals.
- Pn: Number of distinct predicates (declared, defined, called, or updated).
- PAn: Number of predicate arguments (assumed distinct).
- Cn: Number of predicate calls/updates + number of clauses.
- CAn: Number of predicate call/update arguments + number of clause head arguments.
- EV: Entity vocabulary: $EV = Pn + PAn$.
- EL: Entity length: $EL = Cn + CAn$.
- V: Volume: $V = EL * \log_2(EV)$.
- D: Difficulty: $D = (Pn/2) * (CAn/An)$.
- E: Effort: $E = D * V$.
- T: Time required to program: $T = E/k$ seconds (k is the Stroud number; defaults to 18).

- B: Number of delivered bugs: $B = V/3000$.

- Printing of error messages: These messages are always printed by default.
- Printing of debug messages: By default, debug messages are only printed when the debug flag is turned on. The compiler suppresses debug message printing goals when compiling in optimized mode.
- Meta messages: A meta message is a message that have another message as argument and is typically used for debugging messages. Meta messages avoid the need of defining tokenizer rules for every message but can be intercepted as any other message.
- Meta message @Message: By default, the message is printed as passed to the write/1 predicate followed by a newline.
- Meta message Key-Value: By default, the message is printed as “Key: Value” followed by a newline. The key is printed as passed to the write/1 predicate while the value is printed as passed to the writeq/1 predicate.
- Meta message Format+Arguments: By default, the message is printed as passed to the format/2 predicate.
- Meta message List: By default, the list items are printed indented one per line. The items are preceded by a dash and can be @Message, Key-Value, or Format+Arguments messages. If that is not the case, the item is printed as passed to the writeq/1 predicate.
- Meta message Title::List: By default, the title is printed followed by a newline and the indented list items, one per line. The items are printed as in the List meta message.
- Meta message [Stream,Prefix]>>Goal: By default, call user-defined Goal in the context of user. The use of a lambda expression allows passing the message stream and prefix. Printing the prefix is delegated to the goal.
- Meta message [Stream]>>Goal: By default, call user-defined Goal in the context of user. The use of a lambda expression allows passing the message stream.
- Message tokens: at_same_line, tab(Expression), nl, flush, Format-Arguments, term(Term,Options), ansi(Attributes,Format,Arguments), begin(Kind,Variable), and end(Variable).

Remarks:

- Dead code: A predicate or non-terminal that is not called (directly or indirectly) by any scoped predicate or non-terminal. These predicates and non-terminals are not used, cannot be called without breaking encapsulation, and are thus considered dead code.
- Known issues: Use of local meta-calls with goal arguments only known at runtime can result in false positives. Calls from non-standard meta-predicates may be missed if the meta-calls are not optimized.
- Requirements: Source files must be compiled with the source_data flag turned on. To avoid false positives due to meta-calls, compilation of source files with the optimized flag turned on is also advised.

1.38.1 iso8601

ISO 8601 (and European civil calendar) compliant library of date predicates.

Uses:

Remarks:

- Scope: This object currently provides a powerful, versatile and efficient set of date-handling predicates, which—thanks to Logtalk—may be used as is on a wide range of Prolog compilers. Besides taking time to familiarize oneself with each predicate, the user should take note of the following information.
- Validation of dates: Date parts are not validated—that is the caller's responsibility! However, not being quite heartless yet, we do provide a predicate for this purpose.
- Date arithmetic: Many of the examples illustrate a simplified method of doing date arithmetic. Note, however, that we do not generally recommend this practice—it is all too easy to make mistakes. The safest way of finding the day difference between two dates is to first convert the dates to their Julian day numbers and then subtract one from the other. Similarly, the safe way to add or subtract a day offset to a particular date is to first convert the date to its Julian day number, add or subtract the day offset, and then convert the result to its corresponding date.
- BC years: ISO 8601 specifies that the Gregorian calendar be used, yet requires that years prior to 1 AD be handled arithmetically, i.e., the year we know as 1 BC is year 0, 2 BC is year -1, 3 BC is year -2 and so on. We do not follow ISO 8601 with regard to the handling of BC years. Our date predicates will accept and interpret an input year 0 as 1 BC; however, a negative year, Year, should always be interpreted as $\text{abs}(\text{Year}) =:= \text{Year BC}$. We believe that the average person will find our handling of BC years more user-friendly than the ISO 8601 one, but we encourage feedback from users with a view to a possible change in future versions.
- Week numbers: It is possible for a day (date) to have a week number that belongs to another year. Up to three of the first days of a calendar year may belong to the last week (number) of the prior calendar year, and up to three days of the last days of a calendar year may belong to the first week (number) of the next calendar year. It for this reason that the Week parameter in date/6-7 is a compound term, namely week(WeekNo,ActualYear).
- Computation of Gregorian Easter Sunday: The algorithm is based upon the “Gaussian rule”. Proleptic use is limited to years > 1582 AD, that is, after the introduction of the Gregorian calendar.
- Some Christian feast day offsets from Easter Sunday: Carnival Monday: -48 days, Mardi Gras (Shrove Tuesday): -47 days, Ash Wednesday: -46 days, Palm Sunday: -7 days, Easter Friday: -2 days, Easter Saturday: -1 day, Easter Monday: +1 day, Ascension of Christ: +39 days, Whitsunday: +49 days, Whitmonday: +50 days, Feast of Corpus Christi: +60 days.

- xml_spec_reference(Reference) option: Reference to the XML specification file in XML documenting files. Possible values are local (default; DTD/XSD file in same folder as XML files), web (logtalk.org website DTD/XSD file), and standalone (no reference to specification files).

- entity_xsl_file(File) option: XSLT file to use with generated XML documenting files. Default is logtalk_entity_to_xml.xsl, allowing the XML files to be viewed by opening them with a browser supporting XSLT (after running the lgt2xml.sh script on the output directory).
- index_xsl_file(File) option: XSLT file to use with generated XML documenting files. Default is logtalk_index_to_xml.xsl, allowing the XML files to be viewed by opening them with a browser supporting XSLT (after running the lgt2xml.sh script on the output directory).
- xml_docs_directory(Directory) option: Directory where the XML documenting files will be generated. The default value is ./xml_docs, a sub-directory of the source files directory.
- bom(Boolean) option: Defines if a BOM should be added to the generated XML documenting files.
- encoding(Encoding) option: Encoding to be used for the generated XML documenting files.
- omit_path_prefixes(Prefixes) option: List of path prefixes (atoms) to omit when writing directory paths. The default value is to omit the home directory.
- exclude_files(List) option: List of files to exclude when generating the XML documenting files.
- exclude_paths(List) option: List of relative library paths to exclude when generating the XML documenting files (default is []). All sub-directories of the excluded directories are also excluded.
- exclude_prefixes(List) option: List of path prefixes to exclude when generating the XML documenting files (default is []).
- exclude_entities(List) option: List of entities to exclude when generating the XML documenting files (default is []).
- sort_predicates(Boolean) option: Sort entity predicates (default is false).
- Known issues: Some options may depend on the used XSL processor. Most XSL processors support DTDs but only some of them support XML Schemas. Some processors (e.g. fop2) reject reference to a DTD.

1.60 random

object

1.60.1 backend_random

Random number generator predicates using the backend Prolog compiler built-in random generator.

Availability:

Author: Paulo Moura

Version: 1:20:0

Date: 2023-11-24

Compilation flags:

```
static, context_switching_calls
```

Implements:

```
public pseudo_random_protocol
```

Uses:

```
list
```

Remarks:

- Implementation: The backend Prolog compiler built-in random generator is only used for the basic random/1, get_seed/1, and set_seed/1 predicates.
- Portability: B-Prolog, CxProlog, ECLiPSe, JIProlog, Qu-Prolog, and Quintus Prolog do not provide implementations for the get_seed/1 and set_seed/1 predicates and calling these predicates simply succeed without performing any action.

Inherited public predicates:

- Single random number generator: This object provides a faster version of the random library object but does not support being extended to define multiple random number generators.

- Randomness: Loading this object always initializes the random generator seed to the same value, thus providing a pseudo random number generator. The randomize/1 predicate can be used to initialize the seed with a random value.

Remarks:

- Command representation: Use the Redis command name as the functor of a compound term where the arguments are the command arguments.
- Valid arguments: Atoms, integers, and floats. Always use atoms instead of double-quoted “strings”. This helps portability by not depending on the value of the double_quotes flag.

`approximately_equal/2`

Compares two numbers for approximate equality given the epsilon arithmetic constant value using the de facto standard formula $\text{abs}(\text{Number1} - \text{Number2}) \leq \max(\text{abs}(\text{Number1}), \text{abs}(\text{Number2})) * \text{epsilon}$. No type-checking.

Compilation flags:

`static`

Template:

`approximately_equal(Number1,Number2)`

Mode and number of proofs:

`approximately_equal(+number,+number) - zero_or_one`

approximately_equal/3

Compares two numbers for approximate equality given a user-defined epsilon value using the de facto standard formula $\text{abs}(\text{Number1} - \text{Number2}) = < \max(\text{abs}(\text{Number1}), \text{abs}(\text{Number2})) * \text{Epsilon}$. No type-checking.

Compilation flags:

static

Template:

approximately_equal(Number1,Number2,Epsilon)

Mode and number of proofs:

approximately_equal(+number,+number,+number) - zero_or_one

Remarks:

- Epsilon range: Epsilon should be the epsilon arithmetic constant value or a small multiple of it. Only use a larger value if a greater error is expected.
 - Comparison with essential equality: For the same epsilon value, approximate equality is weaker requirement than essential equality.
-

essentially_equal/3

Compares two numbers for essential equality given an epsilon value using the de facto standard formula $\text{abs}(\text{Number1} - \text{Number2}) = < \min(\text{abs}(\text{Number1}), \text{abs}(\text{Number2})) * \text{Epsilon}$. No type-checking.

Compilation flags:

static

Template:

essentially_equal(Number1,Number2,Epsilon)

Mode and number of proofs:

essentially_equal(+number,+number,+number) - zero_or_one

Remarks:

- Comparison with approximate equality: For the same epsilon value, essential equality is a stronger requirement than approximate equality.
-

`tolerance_equal/4`

Compares two numbers for close equality given relative and absolute tolerances using the de facto standard formula $\text{abs}(\text{Number1} - \text{Number2}) = < \max(\text{RelativeTolerance} * \max(\text{abs}(\text{Number1}), \text{abs}(\text{Number2})), \text{AbsoluteTolerance})$. No type-checking.

Compilation flags:

Template:

Remarks:

- Logtalk specific types: entity, object, protocol, category, entity_identifier, object_identifier, protocol_identifier, category_identifier, event, predicate.
- Prolog module related types (when the backend compiler supports modules): module, module_identifier, qualified_callable.
- Prolog base types: term, var, nonvar, atomic, atom, number, integer, float, compound, callable, ground.
- Atom derived types: non_quoted_atom, non_empty_atom, boolean, character, in_character, char, operator_specifier, hex_char.
- Atom derived parametric types: atom(CharSet), atom(CharSet,Length), non_empty_atom(CharSet), character(CharSet), in_character(CharSet), char(CharSet).
- Number derived types: positive_number, negative_number, non_positive_number, non_negative_number.
- Float derived types: positive_float, negative_float, non_positive_float, non_negative_float, probability.
- Integer derived types: positive_integer, negative_integer, non_positive_integer, non_negative_integer, byte, in_byte, character_code, in_character_code, code, operator_priority, hex_code.
- Integer derived parametric types: character_code(CharSet), in_character_code(CharSet), code(CharSet).
- List types (compound derived types): list, non_empty_list, partial_list, list_or_partial_list, list(Type), list(Type,Length), list(Type,Min,Max), list(Type,Length,Min,Max), non_empty_list(Type), codes, chars.
- Difference list types (compound derived types): difference_list, difference_list(Type).

- Other compound derived types: compound(Name,Types), predicate_indicator, non_terminal_indicator, predicate_or_non_terminal_indicator, clause, grammar_rule, pair(KeyType,ValueType), cyclic, acyclic.
- Stream types: stream, stream_or_alias, stream(Property), stream_or_alias(Property).
- Other types: Object::Closure, between(Type,Lower,Upper), property(Type,LambdaExpression), one_of(Type,Set), var_or(Type), ground(Type), types(Types), constrain(Type,Closure), type.
- Type predicate notes: This type is used to check for an object public predicate specified as Object::Functor/Arity.
- Type boolean notes: The two value of this type are the atoms true and false.
- Stream types notes: In the case of the stream(Property) and stream_or_alias(Property) types, Property must be a valid stream property.
- Type order notes: The three possible values of this type are the single character atoms <, =, and >.
- Type character_code notes: This type takes into account Unicode support by the backend compiler. When Unicode is supported, it distinguishes between BMP and full support. When Unicode is not supported, it assumes a byte representation for characters.
- Type Object::Closure notes: Allows calling a public object predicate for type-checking. The predicate should provide valid/2 predicate semantics and assume called with a bound argument. The Closure closure is extended with a single argument, the value to be checked.
- Type compound(Name,Types) notes: This type verifies that a compound term have the given Name and its arguments conform to Types.
- Type between(Type, Lower, Upper) notes: The type argument allows distinguishing between numbers and other types. It also allows choosing between mixed integer/float comparisons and strict float or integer comparisons. The term is type-checked before testing for interval membership.
- Type property(Type, Lambda) notes: Verifies that Term satisfies a property described using a lambda expression of the form [Parameter]>>Goal. The lambda expression is applied in the context of user. The term is type-checked before calling the goal.
- Type one_of(Type, Set) notes: For checking if a given term is an element of a set. The set is represented using a list. The term is type-checked before testing for set membership.
- Type var_or(Type) notes: Allows checking if a term is either a variable or a valid value of the given type.
- Type ground(Type) notes: Allows checking if a term is ground and a valid value of the given type.
- Type types(Types) notes: Allows checking if a term is a valid value for one of the types in a list of types.
- Type constrain(Type,Closure) notes: Allows checking if a term is a valid value for the given type and satisfies the given closure.
- Type type notes: Allows checking if a term is a valid type.
- Type qualified_callable notes: Allows checking if a term is a possibly module-qualified callable term. When the term is qualified, it also checks that the qualification modules are type correct. When the term is not qualified, its semantics are the same as the callable type.
- Design choices: The main predicates are valid/2 and check/3. These are defined using the predicate check/2. Defining clauses for check/2 instead of valid/2 gives the user full control of exception terms without requiring an additional predicate.
- Error context: The built-in execution-context method context/1 can be used to provide the calling context for errors when using the predicate check/3.

- Registering new types: New types can be registered by defining clauses for the type/1 and check/2 multifile predicates. Clauses for both predicates must have a bound first argument to avoid introducing spurious choice-points when type-checking terms.
- Meta-types: Meta-types are types that have one or more sub-type arguments. E.g. var_or(Type). The sub-types of a meta-type can be enumerated by defining a clause for the meta_type/3 multifile predicate.
- Character sets: When testing character or character code based terms (e.g. atom), it is possible to choose a character set (ascii_identifier, ascii_printable, ascii_full, byte, unicode bmp, or unicode_full) using the parameterizable types.
- Caveats: The type argument (and any type parameterization) to the predicates is not type-checked (or checked for consistency) for performance reasons.
- Unicode limitations: Currently, correct character/code type-checking is only ensured for XVM and SWI-Prolog as other backends do not provide support for querying a Unicode code point category.

Public predicates

`new/2`

Creates a new union-find data structure with a list of elements as keys.

Compilation flags:

static

Template:

`new(Elements,UnionFind)`

Mode and number of proofs:

`new(+list(element),?union_find) - zero_or_one`

`make_set/3`

Makes a new set by creating a new element with a unique key `Element`, a rank of 0, and a parent pointer to itself. The parent pointer to itself indicates that the element is the representative member of its own set.

Compilation flags:

static

Template:

`make_set(UnionFind,Element,NewUnionFind)`

Mode and number of proofs:

`make_set(+union_find,+element,?union_find) - zero_or_one`

`union/4`

Merges the two trees, if distinct, that contain the given elements. The trees are joined by attaching the shorter tree (by rank) to the root of the taller tree. Fails if any of the elements is not found.

Compilation flags:

static

Template:

`union(UnionFind,Element1,Element2,NewUnionFind)`

Mode and number of proofs:

```
union(+union_find,+element,+element,?union_find) - zero_or_one
```

union_all/3

Merges the distinct trees for all the given elements returning the resulting union-find data structure. Fails if any of the elements is not found.

Compilation flags:

```
static
```

Template:

```
union_all(UnionFind,Elements,NewUnionFind)
```

Mode and number of proofs:

```
union_all(+union_find,+list(element),?union_find) - zero_or_one
```

find/4

Finds the root element of a set by following the chain of parent pointers from the given element. Root is the representative member of the set to which the element belongs, and may be element itself. Fails if the element is not found.

Compilation flags:

```
static
```

Template:

```
find(UnionFind,Element,Root,NewUnionFind)
```

Mode and number of proofs:

```
find(+union_find,+element,?element,?union_find) - zero_or_one
```

Remarks:

- Path compression: The structure of the tree containing the element is flattened by making every node point to the root whenever this predicate is used on it.
-

find/5

Same as the find/4 predicate, but returning also the rank of the root. Fails if the element is not found.

Compilation flags:

static

Template:

find(UnionFind,Element,Root,Rank,UnionFindOut)

Mode and number of proofs:

find(+union_find,+element,?element,?rank,?union_find) - zero_or_one

Remarks:

- Path compression: The structure of the tree containing the element is flattened by making every node point to the root whenever this predicate is used on it.
-

disjoint_sets/2

Returns the list of disjoint sets in the given union-find data structure.

Remarks:

- On-line documentation: https://binding-time.co.uk/index.php/Parsing_XML_with_Prolog
- Compliance: This XML parser supports a subset of XML suitable for XML Data and Worldwide Web applications. It is neither as strict nor as comprehensive as the XML 1.0 Specification mandates.
- Compliance-strictness: It is not as strict, because, while the specification must eliminate ambiguities, not all errors need to be regarded as faults, and some reasonable examples of real XML usage would have to be rejected if they were.
- Compliance-comprehensive: It is not as comprehensive, because, where the XML specification makes provision for more or less complete DTDs to be provided as part of a document, `xml.pl` actions the local definition of ENTITIES only. Other DTD extensions are treated as commentary.
- Bi-directional conversions: Conversions are not fully symmetrical as weaker XML is accepted than can be generated. Notably, in-bound (Codes -> Document) parsing does not require strictly well-formed XML. If Codes does not represent well-formed XML, Document is instantiated to the term `malformed(<attributes>, <content>)`.

True if Map is a ordered map structure which records the pair Key-Data. Key must be ground.

Compilation flags:

static

Template:

`map_member(Key,Map,Data)`

Mode and number of proofs:

map_member(+nonvar,+nonvar,?nonvar) - zero_or_one

map_store/4

True if Map0 is an ordered map structure, Key must be ground, and Map1 is identical to Map0 except that the pair Key-Data is recorded by Map1.

Compilation flags:

static

Template:

map_store(Map0,Key,Data,Map1)

Mode and number of proofs:

map_store(+nonvar,+nonvar,+nonvar,?nonvar) - zero_or_one

pp_string/1

Compilation flags:

static

Template:

pp_string(String)

Mode and number of proofs:

pp_string(+nonvar) - zero_or_one

fault/5

Identifies SubTerm as a sub-term of Term which cannot be serialized after Indentation. Message is an atom naming the type of error; Path is a string encoding a list of SubTerm's ancestor elements in the form <tag>{(id)}* where <tag> is the element tag and <id> is the value of any attribute _named_ id.

Compilation flags:

```

Mode and number of proofs:

```
exception(+atom,+nonvar,+nonvar,+nonvar) - one
```

document_generation//2

DCG generating Document as a list of character codes. Format is true|false defining whether layouts, to provide indentation, should be added between the element content of the resultant "string". Note that formatting is disabled for elements that are interspersed with pCDATA/1 terms, such as XHTML's 'inline' elements. Also, Format is over-ridden, for an individual element, by an explicit 'xml:space'="preserve" attribute.

Compilation flags:

static

Template:

document_generation(Format,Document)

Mode and number of proofs:

document_generation(+nonvar,+nonvar) - zero_or_one

pcdata_7bit//1

Represents the ASCII character set in its simplest format, using the character entities &, ", <, and > which are common to both XML and HTML. The numeric entity #39; is used in place of ' because browsers don't recognize it in HTML.

Compilation flags:

static

Template:

pcdata_7bit(Code)

Mode and number of proofs:

pcdata_7bit(?nonvar) - zero_or_one

character_data_format/3

Holds when Format0 and Format1 are the statuses of XML formatting before and after Codes - which may be null.

Compilation flags:

static

Template:

character_data_format(Codes,Format0,Format1)

Mode and number of proofs:

character_data_format(+nonvar,+nonvar,?nonvar) - zero_or_one

cdata_generation//1

Holds when Format0 and Format1 are the statuses of XML formatting before and after Codes - which may be null.

Compilation flags:

static

Template:

cdata_generation(Codes)

Mode and number of proofs:

cdata_generation(+list) - zero_or_one
